

PROJECT OVERVIEW

A role-based ERP for textile manufacturing.

Fabrico Industries ERP brings employee self-service, biometric attendance, loom production monitoring, plant operations, sales and invoicing, and enterprise reporting into one console — with each role receiving a focused dashboard built around its own responsibilities, not a shared generic view.

- Employee Portal
- Plant Admin Panel
- Super Admin Panel

Role: UI/UX design (rough layouts, per role)    Build: AI-assisted — Stitch AI, AI Studio, Claude    Stack: React · TypeScript · Vite

Super Admin — Executive Dashboard

PROBLEM STATEMENT

One system, three very different information needs

Textile manufacturing operations involve multiple users with different responsibilities and information needs. Employees require personal attendance, production and compensation information. Plant administrators need operational information such as shift attendance, loom status, approvals and dispatches. Super admins need enterprise-level visibility across employees, administrators, attendance, sales and system controls.

The design challenge was to create one ERP experience that gives each user the right information and actions while maintaining a consistent navigation and interaction model.

**Design question:** How can a role-based ERP provide focused workflows for different users without making the overall system difficult to understand or navigate?

USER ROLES

Each role gets its own navigation, drawn from the same shell

| EMPLOYEE                 | ADMIN / PLANT OPS     | SUPER ADMIN         |
|--------------------------|-----------------------|---------------------|
| My Workstation           | Operations Dashboard  | Executive Dashboard |
| My Attendance & Punches  | Attendance Approvals  | Admin Management    |
| Team Directory           | Shift Team & Roster   | All Employees       |
| My Profile & Payslips    | Fabric Lot Dispatches | Attendance          |
| User & Password Settings | Plant Reports         | Sales & Invoices    |
|                          | Admin Profile         | Reports & Settings  |

USER FLOW

Branching from a single authentication gate

Authentication Gate → Select User Category

- Employee → My Workstation → Attendance → Production → Profile & Payslips
- Admin → Operations Dashboard → Attendance Approvals → Shift/Roster → Dispatches → Plant Reports
- Super Admin → Executive Dashboard → Employees → Admin Management → Attendance → Sales & Invoices → Reports → Settings

LOW-FIDELITY WIREFRAMES

Information architecture, before any visual styling

Before applying color, type or final components, the wireframing stage mapped every screen behind the authentication gate — eleven screens across three roles — to settle hierarchy, navigation and data structure first.

DESIGN DECISIONS

Six decisions that hold the system together

|                                                                                                                                                                                   |                                                                                                                                                                               |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>Role-based experience</b></p> <p>Separate employee, admin and super-admin experiences so users see only the information and actions relevant to their responsibilities.</p> | <p><b>Consistent application shell</b></p> <p>A common top header and sidebar structure persists across roles, while navigation itself changes to match responsibilities.</p> |
| <p><b>Role-specific visual identity</b></p> <p>Green for Employee, orange for Admin, red for Super Admin — reinforcing which role is active at a glance.</p>                      | <p><b>Information hierarchy</b></p> <p>KPIs and operational status are prioritized first, followed by charts and tables, then detailed actions.</p>                           |
| <p><b>Action-oriented dashboards</b></p> <p>Frequent actions — punch out, leave requests, approvals, job assignment — sit close to the information that triggers them.</p>        | <p><b>Data-heavy UX</b></p> <p>Tables, filters, tabs, status badges and pagination handle operational data, rather than relying only on visual cards.</p>                     |

FINAL UI

Three dashboards, one shell

- Employee Portal — My Workstation

Biometric clock, production quota, compensation, punch ledger and employee actions — the information and actions an employee needs on shift, prioritized above everything else.

- Biometric time clock and live shift status
- Production quota tied to the active fabric spec
- Estimated compensation and payslip access

● Plant Admin Panel — Operations Dashboard

Plant operations, shift attendance, loom telemetry, approvals and operational actions — built to read like a control room for the floor.

- Live loom telemetry across machines and lines
- Shift approvals surfaced as a queue with reasons attached
- Fabric lot dispatches and plant reporting in one view

● Super Admin Panel — Executive Dashboard

Enterprise KPIs, attendance overview, sales trends, divisions, policy violations and system status — enterprise-level visibility across every mill.

- Headline KPIs across employees, admins, attendance and sales
- Attendance and sales trends charted side by side
- Standing visibility into policy violations and system uptime

AUTHENTICATION GATE

Role selection, before credentials

Role selection, credentials, security clearance, session unlock and verification all live on one gate. Choosing the panel category first — Employee, Admin or Super Admin — means the rest of the product can commit fully to that role's layout, with the clearance level and scope stated in plain language before sign-in.

## DESIGN SYSTEM

### One shared kit, worn differently per role

Every panel pulls from the same color, type and component tokens. What changes between roles is emphasis and density — not vocabulary.

|                         |                        |                      |             |               |
|-------------------------|------------------------|----------------------|-------------|---------------|
| Super Admin red #E30613 | Employee green #00BB7F | Admin orange #F99C00 | Ink #1A1C1D | Paper #F9F9FB |
|-------------------------|------------------------|----------------------|-------------|---------------|

## TECHNOLOGIES USED

### Design through implementation

|            |                                                                                                           |
|------------|-----------------------------------------------------------------------------------------------------------|
| Frontend   | React, TypeScript, Vite                                                                                   |
| Styling    | Tailwind CSS / CSS-based UI styling                                                                       |
| UI         | Material Symbols and Inter typography                                                                     |
| Design     | Figma, low-fidelity wireframes, user flows and role-based UX                                              |
| AI tools   | Claude, Stitch AI, AI Studio — used to refine rough layouts into final visuals and generate the front-end |
| Deployment | Netlify                                                                                                   |

## UX PROCESS

### From role research to a deployed application

- 01 Understand the ERP context and different user roles.
- 02 Define role-specific information architecture and navigation.
- 03 Map the authentication and role-based user flows.
- 04 Create low-fidelity wireframes for key workflows.
- 05 Establish consistent dashboard, table, form and navigation patterns.
- 06 Sketch rough per-role layouts, then refine into final visuals with AI tools (Claude, v0, Cursor).
- 07 Generate and implement the front-end with AI assistance, then deploy the working application.

## CONCLUSION

### Focused dashboards. One shared shell.

Fabrico Industries ERP demonstrates a role-based enterprise interface where the same system supports different operational needs through focused dashboards, navigation and workflows. The UX approach emphasizes clear information hierarchy, efficient task completion, consistent components and access appropriate to each role.
